

6 reasons you need to backup your Office 365 data

Accidental deletion:

If you delete a user, whether you meant to or not, that deletion is replicated across the network. A backup can restore that user, either to on-premises Exchange or Office 365.

Retention policy gaps and confusion:

Office 365 retention policies are hard to keep up with, let alone manage. A backup provides longer, more accessible retention all protected and stored in one place for easy recovery.

Internal security threats:

Many businesses are experiencing threats from the inside, and they are happening more often than you think. Having a high-grade recovery solution mitigates the risk of critical data being lost or destroyed.

External security threats:

Malware and viruses have done serious damage to organisations globally in just the past year alone. A backup can easily restore mailboxes to an instance before the attack.

Legal and compliance requirements:

Ensure you can retrieve mailbox data during legal action and to meet any regulatory compliance needs.

Managing hybrid email deployments and migrations to Office 365:

Whether you are migrating to Office 365 or have a blend of on-premises Exchange and Office 365 users, the exchange data should be managed and protected the same way, making the source location irrelevant.
